

On July 2, 2024, the Department of Geography organized an engaging and impactful "Eco Enrichment Program" aimed at enhancing the greenery and sustainability of the campus. The event encouraged active participation from both first-year and second-year M.Sc. Geography students, who took part in various eco-friendly initiatives.

The program focused on promoting environmental awareness and practical actions to make the campus more sustainable and green. Activities included tree planting, campus cleanup drives, creating awareness about the importance of biodiversity, and implementing waste management strategies. Students not only contributed physically to these efforts but also learned valuable lessons about environmental stewardship, the significance of maintaining ecological balance, and how they can actively contribute to the planet's well-being.

Through this initiative, the department sought to inspire students to take ownership of their surroundings and cultivate a sense of responsibility towards nature. The Eco Enrichment Program also served as an opportunity for students to apply their academic knowledge in a real-world setting, fostering a deeper connection between the study of geography and practical environmental management.
